EDUCATION

•Kalinga Institute Of Industrial Technology

2021-2025

Bachelor of Technology In Computer Science And Engineering

CGPA:-8.19/Percentage:-81.9

•Little Angels' College

2018-2020

Specialist in Physics,Chemistry and Maths with Computer Science

CGPA:-3.02/Percentage:-75.5

•Kadambari Academy

2018

Secondary Education Examination

CGPA:-3.40/Percentage: 85

PROJECTS

•Facial Expression Recognition Using Vision Transform

2024-04-06

(Tools & technologies used:Python, Numpy, Matplotlib, TensorFlow)

- Spearheaded the development of an image classification model using the Vision Transformer architecture.
- Implemented a model capable of accurately classifying 72 distinct human facial expressions from the complex FER2013 dataset.
- Leveraged Python, NumPy, Matplotlib, and TensorFlow to build a robust model.
- Demonstrated the effectiveness of Vision Transformer architecture for feature extraction and classification in challenging image recognition tasks

•Comparative Analysis: Image-Based Disease Prediction Using KAN, ViT, and CNN

2024-03-13

Tools & technologies used:Python, TensorFlow, Keras,PyTouch,Numpy,Panda,Seaborn

- Conducted a comparative study of deep learning models—Convolutional Neural Networks (CNN), Vision Transformers (ViT),and Kolmogorov-Arnold Networks (KAN)—for predicting five types of diseases from medical images.
- Utilized datasets for pneumonia, kidney stones, lung disease, skin disease, and brain tumors with over 24,000 images; performed preprocessing including normalization, resizing, and augmentation.
- Implemented models using TensorFlow, Keras, and PyTorch; evaluated performance using accuracy, precision, and recall.
- Observed ViT excelled in pneumonia detection (95.43), CNN in kidney stone (95) and skin disease detection (81), and KAN in brain tumor detection (80).
- Highlighted strengths and limitations of each model, suggesting hybrid approaches for future AI-based diagnostics.

•Movie Recommendation System

2025-04-15

Tools & technologies used:Python, TensorFlow, Keras,PyTouch,Numpy,Panda,Seaborn

- Developed a content-based movie recommendation system using Natural Language Processing (NLP) and Cosine Similarity on the TMDB 5000 Movies and Credits datasets.
- Engineered a unified 'tags' feature by extracting and preprocessing genres, keywords, cast, crew, and overviews using NLTK, CountVectorizer, and stemming techniques.
- Converted textual data into numerical vectors and calculated cosine similarity scores to identify and recommend similar movies.
- Integrated a Streamlit web interface for real-time user interaction and deployed the system for accessible personalized recommendations.
- Focused on solving the cold start problem and enhancing recommendation quality through efficient content-based filtering.

SKILLS

Technical Skills:Python, Numpy, Pandas,Java, C++, C, SQL, JavaScript

Miscellaneous: Linux, VS Code, Jupyter Notebook

Soft Skills:Time Management, Teamwork, Problem-solving, Logical Thinking

INTERNSHIP /S

Highway to High-radius Internship Program, Sales & Marketing (May 2024 - June 2024)

- Completed an internship at **Highradus**, where I assisted with technical support, system maintenance, and daily operational activities. During the internship, I worked closely with the team to troubleshoot issues, document processes, and contribute to ongoing projects. This experience strengthened my technical abilities, teamwork, and problem-solving skills.
